Scigeniq TMS

Scigeniq Training Management System (TMS) is a complete training management system that enables pharmaceutical companies to plan, track, and report on training required by their employees.

Scigeniq TMS ensures compliance with rigorous industry regulations by centralizing and automating the company's training program management. A complete training record is built for each employee, documenting the training they require based on their role, their completed training, and any gaps between the two.

TMS Features

Scigeniq TMS automates the entire training process. For example, a training requirement for every affected employee is created when new SOPs are created or new processes are defined. The training asset – a presentation, a video, or a document, for example – is automatically sent to each person who requires the training with a date for completion. After completing the required training, a record of their having received, read, and understood the SOP or process is created.

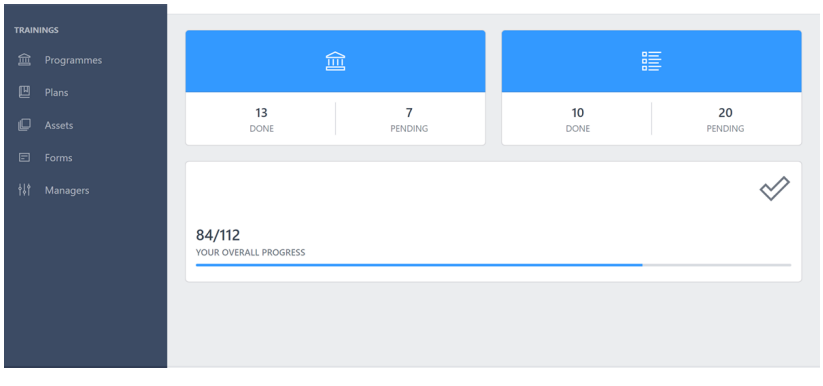
Generate training requirements based on role. When a new item that triggers required training is added to Scigeniq, a new training requirement for every affected individual can be created based on their role.

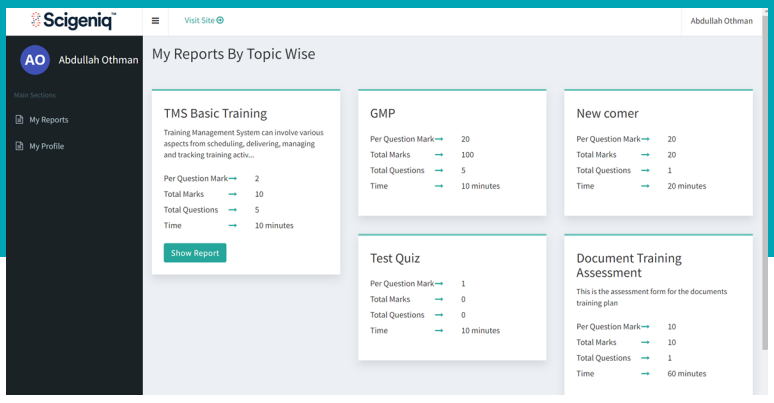
Ensure training tasks are completed. Every training task has a required completion date, and both managers and employees can be notified and reminded as the due date approaches or passes.

Distribute training assets automatically. Training materials, in the form of documents, presentations, or videos, are distributed automatically to every person in a role requiring that training.

Check for competence. A quiz feature allows an employee's competence to be checked after completing the training, with a minimum score required.

Generate complete training records. At any time, a complete set of training records for a single individual, a team, or the entire company can be generated to allow a manager or auditor to review compliance.





Part of the Scigeniq Family of Applications

Scigeniq TMS is part of the Scigeniq family of applications for managing quality and compliance at life sciences companies. We have solutions for managing quality processes from deviation to CAPA right through change control, tracking training activities, and coordinating regulatory submissions and product life cycle management.

Each application shares our commitment to delivering quality management applications that help mid-sized life sciences companies in the Middle East, Africa, and South America, take control of their processes through digital transformation.

More Than Software

The Scigeniq team has deep, unparalleled knowledge of the pharmaceutical industry and quality processes. This expertise is embedded directly into our applications and provided to every customer throughout the implementation process.

That means that our years of expertise are available to you at every step of the process, and proven best practices are “baked into” our applications.

Scigeniq: We Deliver Technology-Based Advantages to our Customers

Scigeniq provides software and expertise to life sciences companies in the Middle East, Africa, South America, and around the world to accelerate their digital transformation. We provide expertise, guidance, and software solutions to our customers, which allows them to rapidly gain new capabilities and advantages based on proven technologies.
